

- 1) Introduction
- 2) Effects of residual gas (and the vacuum envelope)
  - a) Refractive index fluctuation
  - b) Viscosity and Brownian motion
  - c) Mirror contamination
  - d) Light scattering
- 3) Vessels and beam tubes
  - a) Outgassing of stainless steels
  - b) Conductance and pressure gradients
  - c) Cleaning, bakeout and particulate control
  - d) Structural properties and welding
  - e) Detector interfaces
    - i) Flanges and access
    - ii) Structural support penetrations
    - iii) Light baffles
    - iv) Viewports and instrument feedthroughs
  - f) Preventing, finding, and fixing leaks
- 4) Pumping systems and instrumentation
  - a) Cryogenic traps
  - b) Ion & getter pumps
  - c) Residual gas analyzers
- 5) Instrument construction & preparation
  - a) Detector outgassing constraints
  - b) Qualifying materials and processes
  - c) Electronics in vacuum
  - d) Special techniques
    - i) Encapsulated instruments
    - ii) Differential pumping
    - iii) Ionization and residual charge manipulation
    - iv) Thermal exchange gas
